

Setting a Hybrid Seminar in the Colloquium Room

Michael Rozowski and Celine Torres

Updated September 3, 2023

Important: Plan at least 20 minutes for set-up. Always bring spare AAA batteries in case the microphone batteries die.

1. Turn the microphone on using the switch on the top of the device. Check the battery life of the microphone; the screen has a battery life meter. If the meter is low, replace the batteries.
2. (Set-up projector) Go to room control panel and activate “Projector 1” and turn on the room camera.
3. Login to the room computer using your UMD credentials (Directory ID and passphrase). Remember to bring your phone for 2-factor authentication.
4. Open Zoom on the room computer. The member of the audience who monitors the virtual attendees (Host) *cannot* be the person to login to Zoom on the room computer, since Zoom permits only a single account to be logged-in to a single device at a time. The room computer should not be host or co-host of the meeting to avoid, e.g. requests to admit virtual attendees to the Zoom meeting.
5. (Set-up Zoom settings) Click on the gear icon in the upper right corner of the Zoom window to access the Zoom settings.
 - (a) Go to the General tab → Untick “Always show meeting controls”.
 - (b) Go to the Video tab → Untick “Mirror my video”.
 - (c) (Audio Test) Go to Audio tab → Click on “Test Speaker”. If you don’t hear audio from the room speakers, change the speaker. Continue this process until you hear audio from the room speakers. Volume can be adjusted via the speaker settings on the touchscreen or volume of the room computer. The speakers have to be on in order to hear the participants in Zoom. If it’s muted, then online participants can only ask questions in the chat.
 - (d) (Microphone Test) Turn the microphone on. In the Audio tab, check whether the Input Level bar moves as you speak into the microphone. If not, choose another microphone and continue the process until the Input Level moves.
 - (e) Go to Team Chat tab → Change Push Notifications to “Nothing”.
6. Start the seminar’s Zoom meeting on the Host’s laptop.
7. Start the seminar’s Zoom meeting using the Meeting Link or Meeting ID on the room computer. Click the blue button “Join With Computer Audio”.

8. Unmute and start video on the room computer.
9. (Set-up room camera for in-person speaker) Go to room control panel and adjust the camera's angle and zoom-in via the touchscreen. Best is to choose camera "Setting 2" as default. Ask the speaker whether they plan to use the blackboard and where they most likely will be standing. Adjust the zoom and position of the camera with touchscreen accordingly.
10. (Share Screen)
 - (a) (In-person speaker)
 - i. (Speaker uses the room computer, which is preferred) Use the Share Screen feature to share *only* the window containing the speaker's slides.
 - ii. (Speaker uses their own computer) They should also login to the Zoom meeting. Share screen from presenter's laptop. Make sure the presenter's laptop is muted. Audio always goes through room computer. The presenter's laptop should not be host or co-host of the meeting to avoid, e.g. requests to admit virtual attendees to the Zoom meeting.
 - (b) (Virtual speaker) Ask speaker to share their screen. Click the "View" button on the upper right and change to "Speaker view". Pin the speaker.
11. (Meeting controls for in-person speaker) On Zoom Control Panel click "More" and then "Hide Video Panel" and "Hide Floating Meeting Controls".
12. In order to record the talk, the speaker must first consent to being recorded prior to the start of their talk. The member of the audience that monitors the virtual session should start recording before the speaker is introduced and stop recording before the question-and-answer section of the talk.

Comments

- For troubleshooting, call or email IT support: eit-help@umd.edu.
- The host of the Zoom Meeting should allow every participant to share screen.
- If the speaker uses their own laptop they need to be connected to eduroam. It is possible to connect their laptop to the projector directly, but this should be tested before and only used as a last resort. If the speaker has many videos this is something to consider.
- Microphones: There are two different microphones available in the colloquium room: one is typically clipped to the speaker and the other is handheld and typically used by the moderator or audience. Both should work, but they *cannot be turned-on simultaneously*, as the room speakers may not broadcast both microphones and the audio may not be transmitted to the Zoom audience.
- If the speaker is virtual, all questions *must* be asked with the handheld microphone or the speaker will not be able to hear them.
